

CYBER SECURITY EXPERTS

KT SECURE

- Identity and Access Management
- Data Loss Prevention and Data Classification
- Vulnerability Assessment and Penetration Testing
- Cloud Security and Hosting
- Endpoint Protection
- Software Code Signing

KT Secure provides an end-to-end Cyber security solution and a range of managed services. We are the trusted security partner for leading global companies.

The Challenge

Determined hackers and organised criminals multiply as corporate systems, data and identities continue to spread across an ever-increasing number of devices and locations. For businesses, the constant battle between pay-to-enable and pay-to-protect is demanding more time and more budget. It's no longer a one-off piece of work – businesses need proven and reliable expertise to help them build and maintain the best possible and proactive defence against the growing tide of cyber-crime and the proliferation of criminal tactics and techniques.

Our Experience

Our Security Experts have an average of 15 years' experience in designing, implementing and managing security solutions for leading global businesses. They are certified practitioners with real-world experience across a range of industries and Cyber security solutions. Accreditations include CISSP, CISA and CRISC and we have ISO27001, DPA, GDPR, GLBA and PCI DSS expertise.

We are an approved supplier to premium automotive manufacturers, global telecom and financial service providers – but our services are also used in other industries. We aim to provide a personal and flexible service rather than imposing our solutions without careful consideration of your business.

“Very experienced team, impressive knowledge and easy to work with.”

Programme Manager, Car Manufacturer

“KT really know Cyber security, they worked quickly and were flexible to our methodology.”

Ops Director, Insurance

“The work they did for us was well thought out and rigorous. We will use them again.”

Application Development Manager, Telecomms

We provide the following services for use as a complete end-to-end security solution or on a single-service basis, according to your needs.

Security Experts

Our dedicated Security Experts have an average of 15 years industry experience and advanced threat, solution and third-party product knowledge. Experienced and vigilant, you can trust us to advise and run your best possible defence.

Identity and Access Management

We create a 'root of trust' for all your systems and credentials by ensuring the security of your employee identity and access privileges.

Data Loss Prevention

Optimising productivity and cost, we ensure *only* the right people have access to the right data, at the right time. We build in regulatory compliance and data protection by design, protecting you from the unlimited liability that can follow a data breach and substantial fines for failing to protect your customer's personal data (as per the General Data Protection Regulations, GDPR, enforceable from May 2018).

Our cover picture features the Thames Barrier which protects the City of London's financial district against tidal waves and flooding using constantly modulating barrier 'blades' to hold back millions of tonnes of water. We like to compare this instance of leading-edge engineering to the way we protect our client's networks and data – enabling the right traffic to flow smoothly while blocking and eliminating the hidden threats.

Cloud Security

We can help you maximise the financial and operational advantages of cloud-based services without losing control or failing to put in place what is needed to protect your business from determined criminal hackers and other security risks.

Endpoint Protection

We ensure the right software agent is active on the various endpoint devices that access your systems and data, seeking out and neutralising security threats systematically (on PCs, mobiles and IoT devices, for example).

Vulnerability Assessment and Penetration Testing

Our *Attack* team use their vast experience and expertise to simulate criminal ingenuity and test your defences. We use automated scans, manual interventions and security best-practice criteria to identify different types of vulnerability across your systems and apps. We detect, so you can protect.

Software Code Signing

Ensures secure distribution of digitally signed software updates to remote devices or systems (interactive TV apps and Electronic Control Units, for example).

protect your business with proven security solutions ...
